From passionate convertible fan to manufacturer of top quality convertible tops

The first automobile was a convertible, and today, more than 100 years later, the convertible is still a jewel of a car. Convertible drivers are ambitious car drivers who love being just that little bit different.

Some of my convertibles were good fun, but only when the top was down. When the clouds came up, this brought problems with older, leaky tops. Replacements were

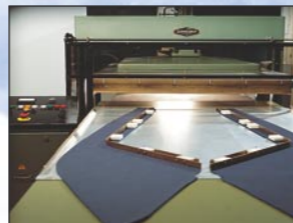

expensive, and delivery frequently took weeks. So this resulted in my ambition to produce top quality convertible tops at a reasonable price.

In 1988 we were the first manufacturer to introduce computerised cutting procedures for car tops, in those days still called HÄRTEL. Today, EUROTOP convertible tops are among the best in the branch, and are supplied to private customers, car dealers and series manufacturers all over the world. Knowing as we do just how a convertible owner passionately loves his vehicle, we will continue to make quality our top priority in future too.

Sincerely yours,

Thomas Härtel

New computerised dimensions for exact production and a super fit

We set the very highest standards for the quality of our convertible tops

Precision technology already helps us during the cutting stage to avoid any fitting problems later on when the convertible top is finished.

We use computerised CAD systems for absolutely high-precision cutting of the convertible tops. Specially developed additional devices draw all the seam lines and the rear window on the top parts. All components are registered and designed to an accuracy of 1/10 mm on the computer. The system calculates the necessary marks which have to be covered when sewing the components together to ensure that no pleats are caused by distortion of the fabric.

Designing the tops components on the computer

Digitisation of a top component tested on the vehicle

State-of-the-art technology is joined by our experience and perfect craftsmanship

Important quality features, such as the run of the fabric, are also taken into account. Once the form of a convertible top has been stipulated by design and trial and error on the vehicle, it is cut out time and again with exactly the same precision.

The tops cut-outs produced on our high-tech machinery are more accurately dimensioned than the best hand cutouts can ever be. Technical perfection and many years of professional experience produce the very best prerequisites for top-rate quality.

Today we work with three computerised cutting systems. EUROTOP also produces headliners and carpet sets with maximum precision.
